

Safety for modern buildings

Lightning and surge protection

Enhanced safety

Lightning and surge protection from DEHN

Always a good feeling

DEHN is your partner for all aspects of lightning and surge protection. Whether planning support, technical consultation, risk analysis or product selection, DEHN is at your side – competent, reliable and “Made in Germany”.

Good reasons to act

Easy planning

DEHN protects.

Safety from a single source

The family-run company offers safety from a single source – as a full-range supplier of coordinated system solutions for earthing, lightning protection and surge protection.

Eliminating risks

Lightning and surge protection are essential components when it comes to preventing fire, guarding against the failure of important networked systems and protecting people. These protection measures are becoming more and more important, above all, in our modern work environment with Industry 4.0 and intelligent buildings.

Prevent unnecessary risks:

- **For people, buildings and sensitive technology** – with the help of an effective protection concept against lightning effects and dangerous surges
- **For your planning** – with support, consulting and know-how from the expert DEHN

Safety from a single source

Make use of the benefits and synergies presented by a wide range of products and services:

- **DEHN is competent:** The family-run company has over 110 years of experience in the field of earthing, lightning protection and surge protection
- **DEHN deals in safety:** The full-range supplier offers coordinated system solutions “Made in Germany”
- **DEHN provides service:** Special software, planning and risk analysis services, and prompt answers to your technical queries
- **DEHN supplies data:** EPLAN, Datanorm, product macros, multi-dimensional drawings, CAD, product specifications for tenders, etc.

DEHN makes you and your customers feel safe – with services which far exceed the standard:

Good reasons to act – Requirements and risks

Why do professional protection measures make sense? There are many good reasons: Technology must be permanently available, climatic conditions are changing, standards and risks must be considered.

Considering changes

Our climate is changing and extreme weather is becoming more common. The risk of lightning strikes and fire or damage due to surges is increasing. At the same time, living comfort and modern work and production processes are dependent on sensitive networked technology.

Profound changes in global power generation pose another special challenge. Network parameters have changed due to the decentralised supply from renewable energy sources. Isolated grids and storage systems are particularly susceptible to surges.

Dangerous mixture			
			
About two million lightning flashes per year	Damage radius of 2 km around the point of strike	Networked building technology	Permanent availability

Fulfilling requirements

Standards and building regulations call for lightning and surge protection measures. There are different requirements for buildings with and without an external lightning protection system. A detailed overview of the relevant standards and legal stipulations can be found in chapter 1 of our Lightning Protection Guide (www.de.hn/lpg).

Overview of the most important standards:

- **Lightning protection:** IEC 62305, 1-4
- **Surge protection:** IEC 60364-4-44, clause 443 and 444, IEC 60364-5-53, clause 534 and IEC 60364-5-54
- **Earthing:** DIN 18014, IEC 61936-1

Identification of risks and determination of the risk potential

Risk management according to IEC 62305-2

A risk analysis allows you to assess and determine the risk potential for structures. This risk analysis forms the basis for specific measures to minimise the risks.

The aim of risk management is to define economically optimal protection measures – tailored to the building characteristics and use.

Preventing danger

Lightning and surge protection are indispensable when it comes to protecting people, preventing fires and guarding important networked systems against failure.

Providing safety

Failure to take proper lightning and surge protection precautions can, in the worst case, result in serious injury or even loss of life. Fires, malfunctions or lack of availability of important systems also have serious consequences – especially for intelligent building systems. Failure of individual net-

worked components, e.g. due to surge damage, may cause entire systems to collapse, paralysing whole buildings or work and production processes. For companies, downtime is not just a matter of high costs and the effort involved in repairing the damage, it may threaten their very existence.

			
Protect human lives	Prevent fire	Avoid stop of production and data loss	Provide security

Lightning protection zone concept

The lightning protection zone concept according to IEC 62305-4 makes it easier to plan, implement and monitor surge protection measures. A building is divided into zones with different risk potential. Inner and outer lightning protection zones are defined according to IEC 62305-4 depending on the lightning threat. Based on these zones, it is determined where measures or arresters are required.

- LPZ 0: Zones outside the building subjected to direct lightning effects, no shielding against LEMP
- LPZ 1: Zone inside the building with a low risk of partial lightning energies
- LPZ 2 – LPZ n: Further zones inside the building with decreasing surge-related risks

More information at: de.hn/cAsjA 

Effective protection concept

Avoid taking unnecessary risks by way of an effective lightning and surge protection concept. This means including the following measures in your designs and planning right from the start:

- Earthing / equipotential bonding
- External lightning protection
- Surge protection

Earthing

Components of the earth-termination system

Foundation and ring earth electrode		Product examples	Part No.
1	 <p>High-quality earthing materials from DEHN provide a solid foundation for the building's earth-termination system. Depending on the type of building, a foundation earth electrode is installed in the foundation and, if required, an additional ring earth electrode outside the foundations</p> <p>Foundation earth electrode: Strip steel, hot-dip galvanised Round steel, hot-dip galvanised Rebar clamp DEHNclip</p> <p>Ring earth electrode: Round steel, StSt V4A Cross clamp</p>	Rd 8-9 mm / Rd 10 mm Rd 8-9 mm / Fl 30 x 3-4 mm	852 335 800 010 308 131 308 141 860 010 319 209
Main earthing busbar and fixed earthing terminal		Product examples	Part No.

Laying the groundwork

Whether existing or new buildings: a functioning earth-termination system is the pre-requisite for the safe operation of electric systems in buildings and for protecting people from dangerous high voltages.

The design and implementation of the earth-termination system are of central importance. After the concrete has set, it is no longer possible to retrofit this vital component, e.g. in the form of a foundation earth electrode.

Omissions or errors during the construction phase cannot be corrected later or, at least, not without a great deal of effort and expense.

Foundation and ring earth electrodes

Foundation or ring earth electrodes are a safe and cost-effective earth-termination system – over the entire lifetime of the building.

The foundation earth electrode is installed in the concrete foundation and covered by at least 5 cm of concrete to ensure corrosion protection. However, in some cases this conductive earth connection may no longer be ensured (foundations with increased earth contact resistance) due to various building construction measures (e.g. when constructing a building made of waterproof concrete). A corrosion-resistant ring earth electrode must then be installed in the ground outside the building foundation and connected to a ring equipotential conductor in the foundation.

Foundation earth electrode

Conventional foundation in direct contact with earth according to DIN 18014

Ring earth electrode

Foundation with increased earth contact resistance Ring earth electrode with functional bonding conductor according to DIN 18014

Pad foundation

Buildings with pad foundations (e.g. for columns) must be connected to a foundation earth electrode with a length of at least 2.5 m in each foundation. To establish equipotential between the pad foundations, these pad foundations must be interconnected in such a way that they are electrically conductive and corrosion-resistant.

External lightning protection

Air-termination system		Product examples	Part No.
1	 <p>Correctly dimensioned air-termination systems prevent direct lightning strikes to a building. They consist of rods, spanned wires / cables and intermeshed conductors and can be combined as needed.</p> <p>Self-supporting airtermination rod Roof conductor holder Air-termination rod DEHNiso spacer</p>		105 530 253 050 103 220 106 115
Down conductor		Product examples	Part No.
2	 <p>A down conductor is a conductive connection between the air-termination system and the earth-termination system. It discharges the intercepted lightning current to the earthtermination system without damaging the building, e.g. as a result of excessive heat.</p> <p>DEHNalu wire Conductor holder DEHNgrip with screw, plastic base and dowel Round wire Number plate</p>		840 028 207 109 860 115 490 110
Connection components (clamps)		Product examples	Part No.
3	 <p>Clamps interconnect conductors or connect them to the installation. They must be subjected to a lightning current test according to IEC 62561-1. DEHN components fully meet this requirement and are reliably tested.</p> <p>MV clamp UNI disconnecting clamp, stainless steel Saddle clamp, aluminium Downpipe clamp</p> 		390 051 459 129 365 031 423 019

Coping with direct lightning strikes

Conventional and isolated lightning protection means fire protection and above all personal protection. Lightning protection systems form a safe shield around the building by intercepting direct lightning strikes and discharging them safely to the ground.

External lightning protection is set out in the IEC 62305 standard and protects buildings from the effects of a direct lightning strike.

A complete lightning protection system consists of the following elements: air-termination system, down conductor system, earthing system, lightning equipotential bonding, separation distances. The lightning current flows into the down conductors via the air-termination system and is conducted to the ground in a controlled manner. The important thing here is that the separation distances from

conductive metal parts are maintained. Otherwise, dangerous flashover can occur which may cause sparking and start a fire. Lightning equipotential bonding reduces the potential differences caused by the lightning current. This is achieved by connecting all isolated conductive system parts directly by means of conductors or by means of surge protective devices (SPDs).

There are two types of external lightning protection system for a building:

Conventional lightning protection

If the separation distances from metal and/or earthed installations is maintained consistently, the air-termination and down-conductor systems – for example round wires or air-termination rods – can be installed on the surface of the building.

Please note: Special requirements must be observed for buildings with thatched roofs!

Product examples for conventional lightning protection can be found on page 8.

If separation distances cannot be maintained due to the properties of the building, consistent lightning equipotential bonding is required. As an alternative, an isolated lightning protection system can be installed.

Isolated lightning protection

In case of an isolated lightning protection system, air-termination rods, air-termination masts or masts spanned with cables protect the entire building against the effects of a direct lightning strike. The separation distance s between the lightning protection system and the building, must be maintained.

HVI Lightning Protection

HVI Lightning Protection comprises a high-voltage-resistant insulated down conductor which, in combination with the relevant supporting tubes and air-terminations rods, forms the isolated lightning protection system. The special feature is that the lightning current carrying conductor is wrapped in semi-conductive insulating material so that the necessary separation distance – be it from other conductive parts of the building or electrical lines and pipes – can be easily maintained. Consequently, further measures such as the additional connection of a braided shield are not required.

HVI Conductors also cater to the desire for a modern appearance and design. The conductors can be painted to match the colour of the building or even installed behind the façade. The system can thus be optimally adapted to the architecture of a building and offers entirely new design possibilities.

Glass-fibre reinforced plastic (GRP)

As an alternative, air-termination and down-conductor systems made of electrically insulating material such as GRP can be mounted on the object to be protected.

Conserving living comfort

Nowadays, smart technology forms the basis for modern living. It offers comfort, security and independence. Surge protection is instrumental in ensuring that this technology is reliable.

Safeguarding living comfort in smart homes

Modern lifestyle is increasingly defined by digital devices: Smart TV, intelligent home automation, burglary protection systems, home office or electromobility to name but a few. A lot of us already take the comfort of smart homes for granted. The downside of smart is that devices are becoming increasingly sensitive and more susceptible to interference. Surges can cause serious interference and damage or even destroy important networked technology. This may cause the entire smart system to collapse leading to a drop in the accustomed standard of living.

Observing surge protection requirements

Vital technology is becoming more and more sensitive and requires greater protection. For this reason, the IEC 60634-4-44 clause 443 and IEC 60364-5-53 clause 534 standards were revised and adapted accordingly. IEC 60634-4-44 clause 443 describes when surge protection measures need be taken in systems and buildings – IEC 60364-5-53 clause 534 explains how to select arresters and install them in the electrical installation. Upon the issue of the new edition of IEC 60364-4-44 clause 443, surge protection became mandatory for new residential buildings.

To ensure comprehensive protection, dangerous surges must be prevented from entering the building. Therefore, measures must be taken for incoming lines such as:

- Power supply lines
- Internet and telephone lines
- Broadband cables
- Lines extending beyond the building

Surge protection is important to ensure that all the devices in modern homes work reliably since there is more at stake than just functioning devices: It is about protecting families, preserving a modern way of life and, for the self-employed, securing their home office and their livelihood.

Find out about further protection measures:

			 <p>TIP Protection proposals for single-family houses can be found in our brochure „Dynamic Times – Relax: DEHN protects residential buildings.“</p>

Keeping working environments up and running

Modern workplaces, office or commercial buildings require reliably functioning technical components to be able to fulfil their function. Lightning and surge protection protect you from disruptions.

Modern work environments are becoming increasingly sensitive

Buildings are becoming smart. They are based on networked technical components which require a permanent supply of power and data. Today modern commercial buildings such as hotels, medical facilities or office buildings are defined by smart building equipment. Here, intelligent systems automatically control and optimise the energy requirement, arrange for the cleaning of only those areas which have really been used and control access via sensitive security technology.

Failure of individual components, e.g., following lightning strikes and surges, may cause the collapse of all networked systems, bringing entire buildings and work environments to a standstill and disabling access control – such horror scenarios can be avoided! Lightning and surge protection precautions ensure that important technology always works safely and reliably.

Regulations call for protection measures

The surge protection requirements of the IEC 60364-4-44 clause 443 and IEC 60364-5-53 clause 534 standards mentioned before also apply to office and commercial buildings. As far as the protection of people is concerned, further building regulations must be observed, e.g., fire protection regulations. Here, lightning and surge protection also makes a significant contribution towards preventing people from sustaining serious injuries and buildings from catching fire.

If medical premises such as diagnosis rooms with MRT or X-ray devices, dental surgeries or day surgery centres are located in commercial buildings, IEC 60364-7-710 also applies. The focus here is on the safety of patients and medical staff. The standard specifies requirements for electrical safety and the uninterrupted power supply in these areas.

Keeping production rolling

Lightning and surge protection concepts ensure that the sensitive networked automation systems of Industry 4.0 are protected, and that plants and production processes are permanently available.

Keeping production rolling

Trouble-free communication of machines and plants in modern production environments requires the consistent flow of both power and information.

Machines must run reliably and work processes function smoothly – even in case of thunderstorms and surges. A production outage can have severe, sometimes even existential, financial consequences. There may also be environmental issues. All these risks can be easily avoided by a carefully planned lightning protection concept.

Considering power and data technology

For industrial companies, it is advisable to install an isolated external lightning protection system. Separation distances are reliably maintained, and lightning energies safely discharged along the outside of the building. This prevents sensitive electric components inside the building from disturbance and destruction.

Combining external lightning protection with internal protection provides additional protection. Protective devices such as ACI or CI arresters secure the power supply and, at the same time, save valuable space. Since these arresters do not require a backup fuse, errors when dimensioning an upstream fuse are automatically excluded. It is also easier to keep connecting cables within the prescribed lengths.

In addition to the power supply, data lines are an important lifeline of modern production plants. Data exchange and networked communication structures are the core components of Industry 4.0. Therefore, all data networks

must be protected against dangerous surges. The main issue here is to choose adequate data and information technology arresters for the relevant system – i.e. ones which are compatible with bus systems such as KNX, DALI.

LED lights

Page 20

Technical building services equipment

Page 21

Ensuring security

So that security systems always work: Electric security systems are only truly reliable if they do not fail during thunderstorms. Surge protection prevents damage and failure.

Ensuring availability

Whether fire precautions, burglary protection or emergency and escape route lighting – security systems must be permanently available. If lightning strikes and surges destroy security systems or safety systems no longer work, lives are at risk.

An important economic aspect: Surges can cause incorrect signals or false alarms, resulting in high follow-up costs. Make sure you integrate all these sensitive safety and security systems in your lightning and surge protection concept to ensure that they always function perfectly.

Meeting requirements

Fulfilling legal and normative requirements is a must for manufacturers, planners and installers. At the same time, requirements for protecting security systems are often complex. One must observe all applicable rules and regulations in the relevant countries and states, e.g. the legal duty to

maintain safety, normative requirements, the technical building regulations law and construction product directives, as well as generally accepted rules of technology and insurance company requirements.

Ensuring power generation

Surge damage due to thunderstorms is one of the most frequent causes of damage to photovoltaic systems. Protection measures increase the availability of your system and secure the yield in the long term.

Protection of rooftop systems

One of the most common forms of PV system is the rooftop system. Due to its exposed position, it is particularly prone to damage caused by direct and indirect lightning effects. Comprehensive protection is therefore required and consists of:

- **External lightning protection** including airtermination and down-conductor system
- **Internal lightning protection** for lightning equipotential bonding using type 1 arresters for electrical systems

Tip: For economic reasons lightning and surge protection should be incorporated at the design stage of PV systems – subsequent installation is much more expensive and time-consuming.

Preventing surge damage

Surges resulting from thunderstorms frequently destroy system parts such as modules, inverters and the monitoring system. The resulting financial loss and costs are considerable, e.g. replacement of a faulty inverter, new installation or loss of revenue during downtime. This can easily be prevented by a lightning protection concept.

By the way: With the publication of the amended IEC 60364-4-44 clause 443, IEC 60364-5-53 clause 534 and IEC 60364-7-712, the installation of overvoltage protection measures becomes mandatory – even if there is no external lightning protection system.

Staying mobile

Mobility is changing rapidly. In the future, charging posts for electric vehicles will be an integral part of the transport infrastructure. These charging posts need to be protected to ensure that electric vehicles are fit for use, even after a thunderstorm.

Protecting charging posts and vehicles

Charging posts are required wherever electric vehicles are parked for a prolonged period of time, e.g. in car parks for residents, customers, patients or employees. Lightning effects and surges pose a risk for the sensitive electronics of the charging post and the vehicle itself.

In case of a thunderstorm, the sensitive electronic circuitry for the controller, counter and communication system is particularly at risk. Satellite systems with interconnected charging points can be completely destroyed by a single lightning strike. Surges during the charging process frequently not only damage the charging post, but also the electric vehicle connected to it.

Electric vehicles generally have an electric strength protection level of up to 2,500 V. However, the voltage occurring during a lightning strike may be 20 times higher. Therefore, prevent damage and meet the normative requirements according to IEC 60364-4-44 clause 443, IEC 60364-5-53 clause 534 and IEC 60364-7-722.

Protect charging systems and electric vehicles from costly damage:

- To the **charge controller** and **Batterie**
- To the control, meter and communication **electronics** of the charging system.

Protection of lighting systems

Surge arresters protect sensitive LED technology from damage, thus preventing cost-intensive failure, time-consuming repair and expensive replacement of LED lights.

Damage caused by surges

Although LED lights have many advantages, their shortcomings over traditional luminaires are that they are more susceptible to surge damage and that the cost of replacement is higher. Such unnecessary costs are easily avoided!

It is not only direct lightning strikes that cause damage. Indirect lightning effects often cause surges which exceed the immunity of sensitive LED lights many times over. This results in partial or complete failure of the LED modules and destruction of the LED drivers. Another risk factor for LED lights is network-generated surges caused by, for example, switching operations which lead to premature ageing of the LED light.

Protective devices prevent failure

Powerful surge arresters protect sensitive LED technology, preventing damage and ensuring the long service life of LED lights. This reduces replacement costs and avoids time-consuming and costly maintenance work. Another advantage: reliable LED lighting ensures uninterrupted work and production processes and, therefore, satisfied users.

Prevent damage and implement a comprehensive surge protection concept:

- Directly at the LED light / light strip.
- In the upstream sub-distribution board.

Upholding the infrastructure

Surge protection for technical building services ensures that the basic supply structures of technical building services are stable and reliable

Closing security gaps

Technical building services include heating, ventilation, sanitary engineering, air-conditioning and electrical engineering, as well as measuring, control and regulation technology. All these services access the power and data systems of the building. However, this also means that operators rely on the protection measures for the electric devices in these systems. But what happens if there are gaps? Central components of the technical building services are then vulnerable to, e.g., dangerous surges. As a result, the heating or ventilation system might no longer work after a thunderstorm and important measuring technology could be destroyed.

Observing framework conditions

IEC 60364-5-53 clause 534 calls for separate surge arresters directly at the consumer (e.g. air-conditioning containers or heating sensor) if the cable length from the upstream electrical connection exceeds 10 m. This is an important aspect which is often neglected in technical building services equipment.

Technical building services equipment in modern buildings is interconnected and interdependent. Many components interact, for example, in the power system, to optimise consumption and save resources. Shading and heating systems or air-conditioning and ventilation processes are controlled by specified temperatures or solar radiation. If a single component fails, the function of the entire system is affected.
